

GE  
Oil & Gas  
PII Pipeline Solutions

# Will your SCC strategy hit the target?

GE's Oil & Gas business can save you time and money identifying the presence of Stress Corrosion Cracking (SCC) in your pipelines. Our knowledge-based approach quickly zeroes in on critical pipelines and directs assessment expenditure only where it's really needed.

SCCScreen™ is part of our integrated 3-phase SCC Management program. Using a combination of proven ILI technologies and crack assessment methods, backed by decades of experience through PII Pipeline Solutions and the industry's most extensive library of validated crack data, SCCScreen determines susceptibility to, and quantifies the presence of, SCC in a pipeline. If you need to reliably assess your pipelines for the existence of SCC, our solution is less disruptive and less expensive than both hydrostatic testing and direct assessment.

In short, SCCScreen helps you manage pipeline safety with the confidence that both you and regulators demand – at a fraction of the cost of conventional methods.
