

# It saves lives, now it can save your pipeline

The new UltraScan™ Duo in-line inspection tool from GE's PII Pipeline Solutions business uses the same phased-array ultrasonic technology that GE Healthcare employs to enhance diagnostic imaging and help save lives.

This revolutionary technology allows pipeline operators to detect both cracking and metal loss in a single inspection. Building on the reliability and accuracy of our UltraScan suite of inspection tools, proven in more than 100,000 miles of pipeline inspections, Duo offers industry-best crack detection capabilities and improves both detection and measurement of pitting corrosion.

UltraScan Duo delivers the high resolution data you need to ensure the integrity of your pipeline – and saves you time and money in the process.
