

An All-New ADRE® System Is On The Way

Development is well-underway on the fifth generation of our ADRE® portable data acquisition system. The new system, ADRE Sxp software and 408 DSPi hardware, will be available in mid-2005. It represents not just an enhancement to the previous-generation product, but a *complete redesign* that retains the best features of all you've come to expect from ADRE instruments while introducing revolutionary new features that dramatically change how data can be acquired and processed in the field, test stand, or shop. Preliminary information on the new system is available now at www.bentley.com, and future issues of ORBIT will provide more in-depth information as the release date for this new product grows nearer. ■
